Site Emergency Response Plan

Fire Emergency
On discovering a fire, activate the nearest pull station and evacuate using the nearest marked exit. Do not use elevators. Fire extinguishers are for small, contained fires only; if the fire grows beyond the size of a trash can, evacuate immediately. The fire brigade assembles at the north gate to brief arriving responders. Department heads confirm their area is clear before leaving the building and report the status to the fire brigade leader at the assembly point. Re-entry is permitted only after the fire department gives an explicit all-clear.

Chemical Spill
Small spills under 1 liter may be contained by trained staff using the spill kits located at each dock bay and the chemical storage room. Spills larger than 1 liter, or any spill involving an unknown substance, require full evacuation of the affected zone and notification of the site safety officer. Ventilation in the affected zone should be increased where safe to do so, and the safety data sheet for the spilled material must be pulled and handed to responders on arrival.

Medical Emergency
Call the site emergency line first, then begin first aid only if trained to do so. Automated external defibrillators are mounted near the break room and the main warehouse entrance. Do not move a seriously injured person unless they are in immediate danger. Someone should be sent to the nearest access road to flag down arriving emergency medical services and guide them directly to the casualty.

Severe Weather
During a severe weather warning, all personnel move to the designated shelter areas in the central corridor, away from exterior windows and large roof spans. Remain sheltered until the all-clear is announced over the site paging system. Forklift and crane operations must stop immediately once a warning is issued, and outdoor contractors must be accounted for along with regular staff.

Evacuation Assembly Points

Warehouse staff assemble at the north parking lot. Office staff assemble at the south courtyard. Shift supervisors take a headcount against the shift roster and report the result to the site safety officer within five minutes of evacuation. Visitors and contractors are accounted for using the sign-in log from the front desk, which the receptionist brings to the assembly point as part of the evacuation procedure. Anyone unaccounted for after the headcount is reported to the fire brigade leader immediately so responders can begin a targeted search rather than a blind sweep of the building.

This plan is reviewed annually and after any incident requiring a full site evacuation, and every department head completes a refresher briefing with their team at each review cycle. New hires receive a walkthrough of their nearest exit routes and assembly point on their first day, before they are assigned to a work area.

Chain of Command

The senior manager on site acts as incident commander until the fire department or emergency medical services arrive and assume control. If the senior manager is unreachable, the shift supervisor with the longest tenure on site takes over the role and briefs the incoming commander on what has been done so far, including whether the building has been fully evacuated and whether anyone is known to be unaccounted for.
